

The NXP ZigBee IoT Gateway Control Bridge provides a means of controlling ZigBee devices via a serial link which is connected to a host controller. The IoT Gateway Control Bridge supports ZigBee Home Automation and ZigBee Light Link, controlling the network by mostly client cluster commands.

This guide provides information to allow users to connect to the Control Bridge using a Graphical User Interface (GUI), which simulates a host, to operate the ZigBee network. It also describes the serial protocol used to interface with the Control Bridge, as well as the payloads of all relevant commands and responses.

# **1 Application Note Overview**

The purpose of this Application Note is to show how a ZigBee Gateway can be controlled by an application running on a PC. It is also to demonstrate the different commands that can be sent in the payload that the ZigBee Control Bridge requires. For information on how to use the ZigBee IoT Gateway Control Bridge with the components in the JN516x-EK004 Evaluation Kit, please refer to the *JN516x-EK004 Evaluation Kit User Guide (JN-UG-3108)*.

This guide is intended to show how to set up and use the Gateway in a simple demonstration network of ZigBee Home Automation (ZHA) devices in order to familiarise users with the functions available in the Gateway firmware. This is done by using the ZigBee Gateway Graphical User Interface (ZGWUI) to interact with the Control Bridge to manage the network and the devices. The ZGWUI is a C# application that acts as a PC host that communicates serially with the JN516x Gateway. The demonstration described in this guide uses the hardware found in the JN516x-EK004 Evaluation Kit. The firmware used in the Gateway is supplied as source code to allow the user to make changes and customise the various components to their needs. Firmware for the devices to be controlled by the Gateway can be built from the Application Notes *ZigBee Home Automation Demonstration (JN-AN-1189)* and the *ZigBee Light Link Solution (JN-AN-1171)*.

# 2 Capabilities

Product Type	Part Number	Build	
Evaluation Kit	JN516x-EK004	-	
JN516x ZLL/HA SDK	JN-SW-4168	1595	
'BeyondStudio for NXP' Toolchain	JN-SW-4141	1308	

The main purpose of this Application Note is to provide a JN516x slave application that receives various commands to control nodes within a ZigBee network. This allows a master (normally a host) to bridge into a ZigBee network while servicing IPV6 devices or other protocols.

The ZGWUI is provided in this Application Note as a way demonstrating all the different features that the JN516x Control Bridge supports. It is also provided as source code, so developers can reference the protocol data sent to the JN516x Control Bridge to aid faster development.

The ZigBee Control Bridge application has been developed to work with the JN516x-EK004 Evaluation Kit.

# **3 What is Provided**

The demonstration package comes with the following components, intended to be used with the hardware in the JN516x-EK004 Evaluation Kit:

- Documentation (this document)
- Application binaries and source code for the following:
  - o ZigBee Control Bridge
  - o ZigBee Graphical User Interface

Although in most cases the ZigBee Control Bridge can be used "as is", developers may want to add extra functionality or even add application-specific behaviour.

To run the demonstration, application binaries are also required for the network nodes:

- ZLL on/off/dimmable colour light (Light\_ExtendedColorLight\_JN5168\_DR1175.bin)
- ZHA on/off/dimmable monochrome light (DimmableLight\_JN5168\_DR1175.bin)

These binaries are provided in the Application Notes *ZigBee Home Automation Demonstration (JN-AN-1189)* and *ZigBee Light Link Solution (JN-AN-1171)*, and must be loaded into boards of the JN516x-EK004 Evaluation Kit (see Section 5.2.3).

# **4** Configuring the Evaluation Kit Hardware

The Control Bridge is compatible with the Raspberry Pi which is supplied in the JN516x-EK004 Evaluation Kit. Set-up and configuration is described in the *JN516x-EK004 Evaluation Kit User Guide (JN-UG-3108)* which is contained in the Application Note *ZigBee IoT Gateway Host with NFC (JN-AN-1222)*. This Application Note is independent of the Raspberry Pi, which will not be described in this document.

# **5 Running the Demonstration**

### 5.1 Programming the JN516x Device

Application Binary		Expansi ( + Carrie	Remote Control	USB		
	Generic	LCD	Lighting/Sensor	Unit	Dongle	
ZigbeeControlBridge_JN5168.bin						
ZigbeeControlBridge_JN5169.bin						

To run the demonstration, the ZigBee Control Bridge binary will need to be programmed into a valid evaluation kit board or USB dongle. This can be done from the 'BeyondStudio for NXP' development platform for JN516x devices. For instructions on using BeyondStudio to program an application into a JN516x device, please refer to the *BeyondStudio for NXP Installation and User Guide (JN-UG-3098)*.

By default, the firmware uses the JN516x UART0 to communicate with the host. Debug can also be enabled on UART1, but this can only be used when a DR1174 Carrier Board fitted with a DR1199 Generic Expansion Board is deployed. Debug can be implemented by connecting a serial cable from the PC to the Generic Expansion Board and opening a

terminal with baud rate 115200 on the PC. This cannot be done on a USB Dongle as there is no UART1 connection available.

### 5.2 Running the ZGWUI

The ZGWUI is a C# application that was developed to allow a ZigBee network to be easily set up and run without needing any special knowledge. Below is a screenshot of the application. The sections that follow explain how to demonstrate the common functionality of the ZGWUI. The ZGWUI application is located in the folder **Tools/TestGUI/ZGWUI**.

NP ZigBee Gatew	ay User Interface

### 5.2.1 Connecting to the Control Bridge

In order to connect to the Control Bridge and issue commands to communicate with ZigBee devices, a serial connection must be set up and opened. To do this, click on **Settings** towards the top-left of the interface.

A pop-up window will appear showing all the available serial connections. Select the correct serial port, configure the baud rate to 1000000, leave all the other settings as default and click **OK**.

NP	ZigBee Gatewa Settings	y User Interface	
	Double click ( USB Serial P	on port you want to use: fort (COM4)	Cluster   Identify
	Baud Rate	1000000 -	it Hex)
	Parity	None	Y V SQ
	Stop Bits Flow Control	1  Vone	s (64-bit Hex)
	ОК	Cancel	Ac
	Permit Join		al (8-bit Hex) N

Now click the **Open Port** button in the ZGWUI. A serial connection to the Control Bridge will be opened with the status shown in the bottom-left corner of the interface.

COM4 1000000-8-N-1 Open

#### 5.2.2 Configuring and Starting a Network

Before initiating a network, some network configuration needs to be done - certain commands need to be run before the network is started, as described below. The description assumes that classical joining will be used to form the network.

A classical network can be created for both ZigBee Home Automation and ZigBee Light Link. In this case, the Control Bridge starts as a Coordinator and allows devices into the network via MAC association. Before you start the network, there are basic commands that can be optionally issued to create a customised network.

The two commands that can be sent are "Set Channel Mask" and "Set Extended PAN ID". The "Set Channel Mask" command informs the Control Bridge which channels the network can start on. The Control Bridge will then chose the best channel available. The **Set CMSK** textbox can be used to specify either a hexadecimal value for a channel mask of possible channels or a decimal channel number if a fixed channel is to be used. The "Set Channel Mask" command can then be issued by clicking the **Set CMSK** button.

0012110	Later and the state of the state of
Set CMSK	20

Indicates the network is to start on channel 20

The **Set EPID** textbox can be used to enter a pre-defined Extended PAN ID (EPID) as a 64bit hexadecimal value. The "Set Extended PAN ID" command can then be issued by clicking the **Set EPID** button.

Set EPID	Extended PAN ID (64-bit Hex)

Once the network has been configured, it can be started. This is done by pressing the **Start NWK** button.

You will receive two messages back which will appear in the **Received Message View** pane in the bottom-right of the interface. The first will indicate a successful execution of the start network command and the second will indicate that the network has been formed, with information about the network parameters.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x00 Message: Type: 0x8024 (Network Up) Status: 0x01 Shott Address: 0x0000 Extended Address: 0x158D000035D02F Channel: 20	

#### 5.2.3 Setting up the Nodes

The demonstration requires the DR1174 Carrier Boards (supplied with the JN516x-EK004 Evaluation Kit) to be configured as lights which can be controlled. Each Carrier Board therefore needs to be fitted with a DR1175 Lighting/Sensor Expansion Board.

Set the jumpers for battery, USB or power supply operation according to how the Carrier boards will be powered during the demonstration. Refer to the *JN516x-EK004 Evaluation Kit User Guide (JN-UG-3108)* for details of the jumper settings.

Plug the Lighting/Sensor Expansion Boards onto the Carrier Boards.

#### 5.2.3.1 Programming the ZigBee Device Binaries

Depending on which type of device and ZigBee network configuration you are demonstrating, you will need to program each light board with the appropriate application binary – one of:

- ZigBee Home Automation monochrome dimmable light (DimmableLight\_JN516x\_DR1175.bin)
- ZigBee Light Link extended colour light (Light\_ExtendedColorLight\_JN516x\_DR1175.bin)

These binaries are supplied in the Application Notes *ZigBee Home Automation Demonstration (JN-AN-1189)* and *ZigBee Light Link Solution (JN-AN-1171)*. They must be programmed into the devices using a JN51xx Flash programming tool, such as the one provided within BeyondStudio for NXP and described in the *BeyondStudio for NXP Installation and User Guide (JN-UG-3098)*.

#### **5.2.4 Joining Nodes to the Network**

To successfully join a node to the network, a network must be started and 'permit join' must be enabled on the network node(s) that other devices will join. In the first (left) **Permit Join** textbox, enter the address of the node on which you wish to allow joining (normally 0x0000 for the Coordinator or 0xFFFC for all Router/Coordinator nodes). In the second (right) **Permit Join** textbox, enter the length of time in seconds for which you require 'permit join' to be active. Both values must be entered in hexadecimal. Click the **Permit Join** button to enable 'permit join' on the specified node(s).

		N	1		N	1
Permit Join	FFFC		FE	NO	CHANGE	•

Broadcast to all Router/Coordinator devices to allow joining for 254 seconds.

When a device joins the network, it will send out a Device Announce message which is captured in the **Received Message View** pane.

Received Message View	Clear
Type: 0x004D (End Device Announce) Short Address: 0x7B7D Extended Address: 0x158D000035C99C MAC Capability: 0x8E Altemate PAN Coordinator: False Device Type: Router Power Source: AC Receiver On When Idle: True Security Capability: Standard Allocate Address: True	

#### **5.2.5 Controlling Devices**

In this example, it is assumed that you have joined a Dimmable Light device to the network. A Dimmable Light device supports the On/Off and Level Control clusters that are used to modify the lighting characteristics of the bulb.

#### 5.2.5.1 On/Off Cluster

Switching a light on or off is done using a command in the ZGWUI that has various attributes added.

Click on the **On/Off Cluster** tab along the top of the interface.

Manageme	nt General	Basic Cluster	Group Cluster	Identify Cluster	Level Cluster	On/Off Cluster	Scenes Cluster	Color Cluster	Doc
OnOff	Bound	Addr 🔻	Address (16-bit H	Hex) Src EP (8-	oit Hex) Ds	t EP (8-bit Hex)	Off	•	

Select the address mode that you would like to use. Then in the three textboxes, enter the 16-bit network address of the node you want to control, the source endpoint number and the destination endpoint number (all in hexadecimal). Finally, select the type of "On/Off" command that you want to send.

Management	General	Basic Cluster	Group Cluster	Identify Cluster	Level Cluster	On/Off Cluster	Scenes Cluster	Color Cluster	Do
OnOff	Short /	Addr 🔻	7B7D	1	1		Toggle	•	
	- <u> </u>								

The light will change its on/off state and a Default Response message will be received in the **Received Message View** pane. The Default Response confirms that a device received the "On/Off" command and processed the command. If the command was not sent via unicast, a Default Response will not be received.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x03 Message: Type: 0x8101 (Default Response) SQN: 0x03 EndPoint: 0x01 Cluster ID: 0x0006 (General: On/Off) Command: 0x02 Status: 0x00	

#### 5.2.5.2 Level Control Cluster

The Level Control cluster allows a bulb's dimmable light level to be set to a specific value. This value can be between 0 and 254 (inclusive), and can be set on the **Level Cluster** tab.

There are a number of attributes that can be passed to the Control Bridge as part of the Level Control cluster's "Move To Level" command:

- Addressing mode
- Hexadecimal destination address
- Source endpoint
- Destination endpoint
- With/without On/Off (indicates whether to modify On/Off state with Level Control)
- Hexadecimal level value
- Hexadecimal transition time (in tenths of a second)

These attributes appear (in the above order) on the **MoveToLevel** line in the interface:

Management	General	Basic Cluster	Group Cluster	Identify Cluster	Level Cluster	On/Off Cluster	Scenes Cluster	Color Cluster	Door Lock Cluster	IAS Cluster	ZL
MoveToLev	el Short	t Addr 👻	7B7D	1	1		With OnOff	- ₹ 2	000/	A	

The command is sent by clicking the **MoveToLevel** button. After sending this command with the above attribute values, the destination light will dim to the lowest level with a 1-second transition. A Default Response will be received in the **Received Message View** pane to indicate that the command was processed.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x09 Message: Type: 0x8101 (Default Response) SQN: 0x09 EndPoint: 0x01 Cluster ID: 0x0008 (General: Level Control) Command: 0x04 Status: 0x00	

#### 5.2.6 Managing Groups

In the ZGWUI, there are several commands available to manage groups and the devices that are members of these groups. All group commands are listed in the **Group Cluster** tab.

Management	General	Basic Cluster	Group Cluster	Identify Cluster	Level Cluster	On/Off Cluster	Sc
Add Group	Addres	s (16-bit Hex)	Src EP (8-bit He	<) Dst EP (8-1	oit Hex) Gro	up ID (16-bit Hex)	)
View Group	Addres	s (16-bit Hex)	Src EP (8-bit He	<) Dst EP (8-1	oit Hex) Gro	up ID (16-bit Hex	)
Get Group	Addres	s (16-bit Hex)	Src EP (8-bit He	<) Dst EP (8-1	oit Hex) Gro	up Count	
Remove Grp	Addres	s (16-bit Hex)	Src EP (8-bit He	<) Dst EP (8-1	oit Hex) Gro	up ID (16-bit Hex)	)
Remove All	Addres	s (16-bit Hex)	Src EP (8-bit He	<) Dst EP (8-ł	oit Hex)		
Add If Ident	Addres	s (16-bit Hex)	Src EP (8-bit Hex	<) Dst EP (8-1	oit Hex) Gro	up ID (16-bit Hex)	)

#### 5.2.6.1 Add Group

You can add a device to a group by sending an "Add Group" command to the device, in order to add the relevant group ID into the device's Group Address table. This is done in the **Add Group** line of the interface by entering the network address of the device, source endpoint number, destination endpoint number and user-defined Group ID, and then clicking the **Add Group** button

,	Management	General	Basic Cluster	Group Cluster	Identify Cluster	Level Cluster	On/Off Cluster	S
	Add Group	706A		1	1	BEE	EF	]

An Add Group Response is then displayed in the **Received Message View** pane with the Group ID and the status of the command.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x00 Message: Type: 0x8060 (Add Group Response) SQN: 0x00 EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Status: 0x00 Group: 0xBEEF	

To verify that this group has been added, try sending an "On/Off" command with the group address you have just added. This will toggle the on/off state of the light. Note that since this is a groupcast, a Default Response will not be received.

Management	General	Basic Cluster	Group Cluster	Identify Cluster	Level Cluster	On/Off Cluster	Scenes Cluster	Color Clust
OnOff	Group	Addr 🔻	BEEF	1	1		Toggle	•

#### 5.2.6.2 View Group

You can find out whether a device is a member of a specific group by sending a "View Group" command to the device. This is done in the **View Group** line of the interface by entering the network address of the device, source endpoint number, destination endpoint number and Group ID of the relevant group, and then clicking the **View Group** button.

View Group	706A	1	1	BEEF

If the device is a member of that group, you will receive a View Group Response with a status of "Success" (0x00).

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x02 Message: Type: 0x8061 (View Group Response) SQN: 0x02 EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Status: 0x00 Group: 0xBEEF	

If the device is not a member of that group, you will receive a View Group Response with a status of "Not Found" (0x8B).

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x04 Message: Type: 0x8061 (View Group Response) SQN: 0x04 EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Status: 0x8B Group: 0xAAAA	

#### 5.2.6.3 Get Group Membership

You can find out which groups a specific device is a member of by sending a "Get Group Membership" command to the device. This is done in the **Get Group** line of the interface by entering the network address of the device, source endpoint number, destination endpoint number and group count (number of groups you want to look for), and then clicking the **Get Group** button.

Ľ		חטטופא (דטיטור דופאן	SIG EL (O'DIL HEAJ	DSLET (ODILITICA)	Group to (Torbit Hex)
	Get Group	42C3	1	1	0
	Remove Gm	Address (16-bit Hev)	See EP (Shit Hev)	Det EP (Shit Hev)	Group ID (16-bit Hev)

If the device is a member of any groups, it will respond with the number of groups and the group addresses of the groups to which it belongs.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x03 Message: Type: 0x8062 (Get Group Response) SQN: 0x03 EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Capacity: 7 Count: 1 Group 0: 0xAAAA	

If the device is not a member of any groups, it will respond with an empty group list with a count of 0.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x05 Message: Type: 0x8062 (Get Group Response) SQN: 0x05 EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Capacity: 8 Count: 0	

#### 5.2.6.4 Remove Group

You can remove a group from a device's Group Address table by sending a "Remove Group" command to the device. This is done in the **Remove Grp** line of the interface by entering the network address of the device, source endpoint number, destination endpoint number and the relevant Group ID, and then clicking the **Remove Grp** button.

If the device is a member of the group that you are trying to remove then it will respond with a status of "Success" (0x00).

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x07 Message: Type: 0x8063 (Remove Group Response) SQN: 0x07 EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Status: 0x00 Group: 0xAAAA	

If the group does not exist on the device then it will respond with a status of "Not Found" (0x8B).

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x08 Message: Type: 0x8063 (Remove Group Response) SQN: 0x08 EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Status: 0x88 Group: 0xBEEF	

#### 5.2.6.5 Remove All Groups

You can remove a device from all groups by sending the "Remove All Groups" command to the device. This is done in the **Remove All** line of the interface by entering the network address of the device, source endpoint number and destination endpoint number, and then clicking the **Remove All** button.

<u> </u>			
Remove All	42C3	1	1
		0.00/01/01	

Irrespective of whether the device is associated with any groups, it will always respond with a status of "Success" (0x00).

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x0C Message: Type: 0x8101 (Default Response) SQN: 0x0C EndPoint: 0x01 Cluster ID: 0x0004 (General: Groups) Command: 0x04 Status: 0x00	

#### 5.2.6.6 Add Group If Identifying

You can attempt to add a device to a group if the device has been put into Identify mode by sending the "Add Group If Identifying" command to the device. This is done in the **Add If Ident** line of the interface by entering the network address of the device, source endpoint number, destination endpoint number and the Group ID to be allocated, and then clicking the **Add If Ident** button.

Add If Ident	42C3	1	1	AAA

This command does not send a response back to the host, but you can perform a send "Get Group Membership" command to verify that device is a member of the group.

#### 5.2.7 Managing Scenes

In the ZGWUI, there are several commands available to manage scenes and the devices that participate in these scenes. All scene commands are listed in the **Scenes Cluster** tab. To be able to use a scene command, the target device must be a member of a group with an associated scene.

#### 5.2.7.1 Add Scene

The "Add Scene" command allows a scene with specified Scene ID (associated with a particular Group ID) to be added on a remote device. You can also add a scene using the "Store Scene" command (see Section 5.2.7.2).

#### 5.2.7.2 Store Scene

The "Store Scene" command instructs a device to save its current state in a scene (new or existing). This is done in the **Store Scene** line of the interface by entering the addressing mode, address of the device, source endpoint number, destination endpoint number, Group ID and Scene ID, and then clicking the **Store Scene** button.

Store Scene Short Addr   42C3	1	1	AAAA	1

This results in the following "Store Scene Response" command which is displayed in the **Received Message View** pane.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x05 Message: Type: 0x80A4 (Store Scene Response) Tx Num: 0x05 Source Endpoint: 0x01 Cluster ID: 0x0005 Status: 0x00 Group ID: 0xAAAA Scene ID: 0x01	

The above output indicates that the device state has been successfully stored in the scene with Scene ID 0x01 associated with the group with Group ID 0xAAAA

#### 5.2.7.3 Recall Scene

. .

The "Recall Scene" command instructs a device to restore a previously saved scene in the device - for a light bulb, this could be restoring an on/off or level state. This is done in the **Recall Scn** line of the interface by entering the addressing mode, address of the device, source endpoint number, destination endpoint number, Group ID and Scene ID, and then clicking the **Recall Scn** button.

Recall Scn Short Addr -	64ef	1	1	AAAA	1

When the command is sent, a response will appear in the **Received Message View** pane indicating whether the command has been successful.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x09 Message:	

#### 5.2.7.4 View Scene

You can view the details of a scene (e.g. on/off state, level) on a device by sending a "View Scene" command to the device. This is done in the **View Scene** line of the interface by entering the addressing mode, address of the device, source endpoint number, destination endpoint number, Group ID and Scene ID, and then clicking the **View Scene** button.

View Scene Short Addr -	42C3	1	1	AAAA	1

After sending a successful "View Scene" command, a response containing vital information like Transition time, Scene Name Length, Scene Name and Scene Data will be displayed in the **Received Message View** pane.

Received Message View	Clear
Status: 0x00 (Success)	*
Message:

#### 5.2.7.5 Get Scene Membership

You can find out which scenes associated with a particular group are available on a device by sending a "Get Scene Membership" command to the device. This is done in the **Get Memb** line of the interface by entering the addressing mode, address of the device, source endpoint number, destination endpoint number and Group ID, and then clicking the **Get Memb** button.

Get Memb	Short Addr 🔹	42C3	1	1	AAAA

After sending a successful "Get Scene Membership" command, a response listing the number of scenes and the Scene IDs available will be displayed in the **Received Message View** pane.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x0B Message: Type: 0x80A6 (Get Scene Membership Response) Tx Num: 0x0B Source Endpoint: 0x01 Cluster ID: 0x0005 Status: 0x00 Capacity: 0x0F Group ID: 0xAAAA Scene Count: 0x01 Scene List: Scene: 0x01	

#### 5.2.7.6 Remove All Scenes

\_\_\_\_\_

You can remove all scenes associated with a particular group on a device by sending a "Remove all Scenes" command to the device. This is done in the **Remove All** line of the interface by entering the addressing mode, address of the device, source endpoint number, destination endpoint number and Group ID, and then clicking the **Remove All** button.

Remove	e All Short Addr 🗸 🔻	42C3	1	1	AAAA

After sending a successful "Remove All Scenes" command, a response indicating whether the removal was successful will be displayed in the **Received Message View** pane.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x0E Message: Type: 0x80A3 (View Scene) SQN: 0x0E EndPoint: 0x01 Cluster ID: 0x0005 Status: 0x00 Group ID: 0xAAAA	

#### 5.2.7.7 Remove Scene

You can remove a specific scene associated with a particular group on a device by sending a "Remove Scene" command to the device. This is done in the **Remove** line of the interface by entering the addressing mode, address of the device, source endpoint number, destination endpoint number, Group ID and Scene ID, and then clicking the **Remove** button.

ve Short Addr 👻	42C3	1	1	AAAA	1

After sending a successful "Remove Scene" command, a response indicating whether the removal was successful will be displayed in the **Received Message View** pane.

Received Message View	Clear
Type: 0x8000 (Status) Length: 4 Status: 0x00 (Success) SQN: 0x11 Message: Type: 0x80A2 (View Scene) SQN: 0x11 EndPoint: 0x01 Cluster ID: 0x0005 Status: 0x8B Group ID: 0xAAAA Scene ID: 0x01	

#### 5.2.8 Running Over-The-Air (OTA) Upgrade

The ZGWUI provides an interface to perform an Over-The-Air (OTA) upgrade. This involves loading an application binary that will be served out 'over the air' to devices in the network. The following sections demonstrates how OTA upgrade is executed on the ZGWUI. This demonstration assumes that you have devices in the network which have the OTA Upgrade client cluster implemented. This document will describe the process of OTA upgrade on a Dimmable Light device. For this example, the following binary is initially used in the Dimmable Light:

#### DimmableLight\_JN516x\_DR1175\_LED\_EXP\_MONO\_OTA\_Client\_v1.bin

This application is supplied in the Application Note *ZigBee Home Automation Demonstration* (*JN-AN-1189*) and must be loaded into a network node (see Section 5.2.3).

#### 5.2.8.1 Loading the Upgrade Binary

To perform an OTA upgrade, the relevant upgrade binary file needs to be loaded into the ZGWUI application. Click on the **OTA Cluster** tab, which is displayed as follows:

Management General Basic Cluster Gr	roup Cluster Identify Cluster Level Clu	ster On/Off Cluster	Scenes Cluster	Color Cluster	Door Lock Cluster	IAS Cluster	ZLL Touchlink	ZLL On/Off Cluster	ZLL Color Cluster	OTA Cluster	
Load Image Manu Code	Image Type File Version	Size									
Image Notify Bound Addr 🔹 Ad	ddress (16-bit Hex) Src EP (8-bit Hex)	Dst EP (8-bit Hex)	JITTER	•	/ersion (32-bit Hex)	Image Type	(16-bit Hex) Ma	anu ID (16-bit Hex)	Query Jitter (8-bit He	0	
Download Status Pro	rogress			1	File Offset						

Click the **Load Image** button to bring up the file explorer window. Navigate to the folder which contains the OTA upgrade binary file that is to be used to upgrade the remote device and select the file – this is a **.ota** file, in this case:

#### DimmableLight\_JN516x\_DR1175\_LED\_EXP\_MONO\_OTA\_v2.ota

This file is supplied in the Application Note *ZigBee Home Automation Demonstration* (*JN-AN-1189*), which must be present on your PC.

After loading the binary file, the ZGWUI will populate the Load Image textboxes with some useful data, including manufacturer code, image type, file version and binary size.

l	📮 ZigBee Gateway User Interface				
ſ	Settings Close Port About				
	Management General Basic Cluster Group Clu	uster Identify Cluster Level Cluster On/Off Cluster S	Scenes Cluster   Color Cluster   Door Lock Cluster	IAS Cluster ZLL Touchlink ZLL On/Off Cluster	ZLL Color Cluster OTA Cluster
	Load Image Manu Code 1037 Image	e Type 0101 File Version 00000002 Size	150158		
	Image Notify Bound Addr 🔻 Address (	(16-bit Hex) Src EP (8-bit Hex) Dst EP (8-bit Hex)	JITTER   Version (32-bit Hex)	Image Type (16-bit Hex) Manu ID (16-bit Hex) G	Juery Jitter (8-bit Hex)
	Download Status Progress		File Offset		

The ZGWUI also sends a serial command to the Control Bridge to inform the OTA Upgrade cluster of the loaded binary. The OTA header information is sent, which is loaded into the OTA Upgrade server. This means that when a remote device sends an image request to the server, the Control Bridge will be able to reply indicating that there is an image available.

Raw Data	Clear	F
08:51:36.174 -> 01 02 15 02 10 02 10 48 FE 02 12 02 10 02 10 02 18 EE F1 1E 02 11 02 10 02 10 38 02 10 02 10 10 37 02 11 02 11 02 10 02 00 20 10 02 12 44 52 31 31 37 35 72 31 76 31 55 4E 45 4E 43 52 59 50 54 45 44 30 30 30 30 30 4A 4E 35 31 36 38 02 10 02 12 4A 8E 02 10 56 12 4A 50 02 10 11 78 33 22 03	2 10 02 10 02 12 34 12 02 10 02	

#### 5.2.8.2 Image Notify

The "Image Notify" command is used to inform all relevant devices in the network that an OTA upgrade image is available (only devices to which the image is applicable are notified). This command contains the following parameters:

- Addressing mode
- Destination address
- Source endpoint
- Destination endpoint
- Image notify payload type
- Version
- Image type
- Manufacturer ID
- Query jitter

For descriptions of the "image notify payload type" and "query jitter" parameters, please refer to the description of the tsOTA\_ImageNotifyCommand structure in the ZigBee Cluster Library User Guide (JN-UG-3103).

The version, image type and manufacturer ID are visible in the **Load Image** textboxes, which can be seen below along with the line for the **Image Notify** command.

Load Image	Manu Code	1037	Image Type	0101	File Version	0000002	Size	150158				
Image Notify	Broadcast	•	FFFC	1		1		JITTER -	0000002	0101	1037	64

The above command notifies all relevant devices in the network and instructs all of them to upgrade straight away.

#### 5.2.8.3 Device Updating

When a device has determined that the OTA upgrade binary on the host is relevant to itself (regardless of whether it was informed via an Image Notify command or as the result of an update request), the device will start upgrading.

The progress bar in the ZGWUI, shown below, indicates the current status of the upgrading device. The File Offset value is the number of bytes the server has sent to the device so far.

Note that there is only one progress bar and if you have multiple devices upgrading, the bar will appear slightly random, as it will reflect whichever device is requesting a block of data.

When a device has finished upgrading, the download status will change to "Complete" and the progress bar will reset.

Download Status Complete Progress		File Offset
-----------------------------------	--	-------------

Upon completing an OTA upgrade, an End Request is sent to the host (containing the OTA header information the device received from the OTA server) in order to indicate that the device is going to reset.

# 6 ZGWUI Source

The ZGWUI is provided as both executable and source code. It is provided as source code to give the developer information on which data is sent to the Control Bridge and how it is sent. This should speed up application porting and reduce mistakes made during application development. Although it provides most of the functionality supported by the Control Bridge, the ZGWUI does not support all features. Custom features that are added to the Control Bridge by the developer will also need to be added to the ZGWUI for testing purposes.

The ZGWUI application is built using the Visual Studio 2012 IDE which is based on C# code.

# 7.2 New Features

ID	Feature	Description
Version 101	4	
lpsw8374	Added Support for APS and MAC ACKs	Added support to the Control Bridge to write a message when an APS or MAC ACK occurs, if enabled.
lpsw8402	Added Support for Network State command to the ZGWUI	Added support for the Network State command to the ZGWUI, which allows the user to check the network details at any time.
Version 101	3	
Version 101	2	
lpsw7632	Added Fan Control Cluster Parsing	Added the Fan Control Cluster (0x0202) to the list of clusters that are parsed by the displayClusterId function.
lpsw8324	Made Add Scene Extension Fields Optional	The extension fields for the Add Scene function are now optional and can be shown or hidden by toggling a checkbox.
Version 101	1	
lpsw7651	Added Combo Box to ZGWUI	Added a combo box to select the data type when performing a write attribute request.
lpsw7723	Added IAS WD Parsing	Added the IAS WD Cluster (0x0502) to the list of clusters that are parsed in the GUI
lpsw7725	Renamed IAS Cluster Tab	Renamed the 'IAS Cluster' tab to the 'IAS Zone Cluster' tab.
lpsw7735	Added IAS WD Cluster Tab	Added tab for IAS WD Cluster.
lpsw7752	Added Thermostat UI Config Cluster Parsing	Added the Thermostat UI Config Cluster (0x0204) to the list of clusters that are parsed in the GUI.
lpsw8161	Added Discovery Only Response	Added a Discovery Only Response to Control Bridge and ZGWUI to print received beacon details.
lpsw8162	Added Discovery Only Command	Added a Discovery Only command to Control Bridge and ZGWUI.
Version 101	0	
lpsw7420	Hardware Debug added to makefile	Changed the makefile to allow a hardware debug version to be built with the correct file name extension in future.
lpsw7504	ZGWUI support for Group Name added	Added group name support to the ZGWUI.
lpsw7636	Fan Control Cluster added	Added Fan Control to the list of cluster that are parsed by the displayClusterId function.
lpsw7793	Enhanced binding layout	Reorganised the bind request layout to be more logical in the ZGWUI.
lpsw8142	Enhanced unbinding layout	Reorganised the unbind request layout to be more logical in the ZGWUI.
lpsw7913	Function to display all devices in network added	Added a Discover Devices function to the ZGWUI.
Version 100	9	
lpsw6940	Discover Individual Attribute Response added	Added Discover Individual Attribute Response to the Control Bridge.
lpsw7519	OTA header string field added	Added fields to show more OTA image content when a file is loaded.
lpsw7637	Poll Control cluster client support added	Added Poll Control cluster client to Control Bridge.
lpsw7774	Poll Control cluster client commands added	Added Poll Control cluster client commands to ZGWUI.

lpsw7821	Option to request Default Responses added	Added an option to enable/disable the request for Default Responses to the Control Bridge.
lpsw7831	OTA image content added	Added fields that show additional OTA image content.
lpsw7856	Option to switch on/off Default Response request added to GUI	Added an option to enable/disable the request for Default Responses to the ZGWUI.
lpsw7914	Tooltips added for all fields	Added tooltips to all the fields on the ZGWUI to give more detailed information.
lpsw7915	Restore default text, if empty	Restored the default textbox text when it is empty in the ZGWUI
Version 100	8	
Version 100	7	
Version 100	6	
lpsw7379	Start attribute added	Added a start attribute field to the 'discover all attributes' request. This allows multiple requests to be sent if all the attributes cannot fit in one response.
lpsw7415	ZGWUI parsing for Simple Sensor	The ZGWUI parses the device type 'Simple Sensor'.
lpsw7422	ZGWUI parsing for Binary Input cluster	The ZGWUI parses the cluster 'Binary Input'.
lpsw7439	ZGWUI parsing IAS ACE	The ZGWUI parses the device type 'IAS ACE'
lpsw7574	ZGWUI parsing Illuminance Measurement cluster	The ZGWUI parses the cluster 'Illuminance Measurement'
lpsw7576	Support for latest SDK	Makefile changes to support the latest JN-SW-4168 SDK.
Version 100	5	
lpsw6841	Complex Descriptor Support	Added the 'complex descriptor request' to the ZGWUI and Control Bridge.
lpsw6934 lpsw6935	User Descriptor Support	Added the 'user descriptor request' and 'user descriptor set request' to the ZGWUI and Control Bridge.
lpsw7074 lpsw7351	OTA Wait for Data Support	Added support in the Control Bridge and ZGWUI for the 'OTA wait for data' command within the block response payload.
lpsw7350	Display decimal values for version	The ZGWUI displays the version of the application and the SDK on which it was built in decimal instead of hexadecimal format.
lpsw7227	Attribute report indication serial protocol definition	The 'attribute report indication' serial protocol command is now defined in the documentation.
Version 100	4	
Version 100	3	
Version 100	2	
lpsw6924	Raw Data Send	Added feature to send raw payload which supports ZCL on host.
Version 100	1	
N/A	SDK Version	Migrated to version 1364 of the JN-SW-4168 JN516x ZLL/HA SDK

# 7.4 Bug Fixes

ID	Description
Version 1014	
lpsw7032	Fixed issue where the status was saved to the status buffer during E_ZCL_CBET_REPORT_INDIVIDUAL_ATTRIBUTE.
lpsw7220	ZGWUI previously had an issue where it would not decode Identify messages. This is now resolved.
lpsw7237	Fixed issue where the OTA progress bar would carry on flashing after an OTA upgrade was complete.
lpsw7711	There were typo errors for Remove Scene and Remove All Scenes responses in the ZGWUI. These are now parsed correctly.
lpsw8372	Previously, the sequence number was not set. Resolved this by setting it equal to eZCL_GetLastSequenceNumber.
lpsw8373	The stack event was not set to APS ACK, and therefore was never triggered. Solved this issue.
lpsw8431	Fixed an issue where a child that changed parents would not be removed from the Router's neighbour table because it was powered off.
Version 1013	
Version 1012	
lpsw8357	Fixed issue where OTA Upgrade Time would use 0xffffffff by default, therefore the image does not upgrade. OTA now upgrades after 5 seconds.
Version 1011	
lpsw8231	Fixed issue where the channel check on Discovery Only response beacons was wrong and would look for a beacon on a different channel.
lpsw8263	Fixed issue where a stack dump would occur when Discovery Only command was sent and no channel was selected on the GUI.
lpsw8267	Fixed issue where a Discovery Only command could only be sent once.
Version 1010	
lpsw7038	Fixed issue where the APS Data Confirm Fail command was not parsed correctly in the GUI.
lpsw7500	Updated the GUI to display the correct name when both the Thermostat Device ID and Cluster ID are received.
lpsw7713	Fixed issue where user input text in a text box would be cleared upon mouse click in the ZGWUI.
lpsw7929	Fixed issue where the APDU was not being freed when service discovery ZPS functions were called.
lpsw7943	Fixed issue where the ZCB Active Endpoints Request command listed incorrect endpoint values.
lpsw7944	Fixed issue where a status message was only copying one byte to the buffer when it should be two bytes.
lpsw7951	Fixed issue where the ZCB Get Membership command listed incorrect scene values.
lpsw7984	Fixed an issue that could cause a CRC failure due to adding a NULL value when failing to read a byte off the queue.
lpsw8110	Fixed issue where debug was not available on UART1.
lpsw8111	Fixed issue with Scene Name where only one character could be passed instead of the full character array.
lpsw8120	Fixed ZGWUI issue where some fields did not format properly when grey text was restored.
Version 1009	
lpsw6761	Fixed issue by which the Get Version command would receive two status messages in response (rather than one).
lpsw7586	Implemented Add Scene function in full.
lpsw7650	Fixed incrementing issue in sendWriteAttribRequest loop.
lpsw7855	Added 'Add Scene' command to the ZGWUI.

lpsw7661	Fixed issue with Remove Device command sending the parent IEEE address instead of the child IEEE address
Version 1008	
Version 1007	
Version 1006	
lpsw6953	Fixed String bug when sending attributes of type string. Previously they were sent with a size of 1.
lpsw7241	ZGWUI did not parse the string value correctly.
lpsw7498	The destination and source endpoint for the 'Add Group' command were inconsistent with the rest of the ZGWUI application.
lpsw7569	Fixed Touchlink bug where it would send an encrypted network key as all zeros.
lpsw7568	Fixed Touchlink bug where it would send Touchlink commands at full power.
lpsw7575	Fixed Debug bug where turning on debug in the makefile was using the 'DEBUG' instead of using the 'DEBUG_PORT' flag.
lpsw7577	Fixed bug with ZGWUI where the 'Bind Target Extended Address' tooltip was not working.
Version 1005	
lpsw7238	Fixed versioning bug when loading an OTA image into the ZGWUI.
lpsw7349	Fixed 'get version' command which always responded with version 0.
lpsw7348	Removed a label in the ZGWUI which should not have been present.
lpsw7347	Fixed version number which was being incorrectly parsed from the ZGWUI.
lpsw7148	Updated description of 'move to level with/without on/off' command in Serial Command Set appendix to include missing OnOff byte.
lpsw7342	Removed the ZGWUI-User-Guide.pptx as all the information is within this document.
Version 1004	
N/A	Build release issue that inserted an SDK path and APP path onto the build configuration line which caused a compile error.
Version 1003	
lpsw6964	Fixed such that the Identify Query response from the Control Bridge only returns the full response payload on success. In the case of failure, it only responds with the group, cluster and status.
lpsw6968	Fixed such that the Identify Query command handler in the Control Bridge reads bytes 5 and 6 for the identify time. Previously, it was reading bytes 6 and 7, meaning byte 5 was empty.
lpsw6969	ZGWUI sends the correct Identify Query request command payload. This means it is now sending one less byte, as it was previously sending an empty byte.
lpsw7081	The Control Bridge now resets after receiving an Erase EEPROM command.
lpsw7082	Fixed such that the application state is now consistent with the ZigBee PRO stack state.
lpsw7132	Fixed such that the Write Attribute request in the ZGWUI is now doing a 'Char to Hex' byte copy as opposed to an ASCII array copy.
lpsw7136	The Write Attribute command is no longer adding payload space for a manufacturer code when it is not needed, which caused it to appear as two attributes in the sniffer.
Version 1002	
lpsw6810	Version number has been created to match the application note version.
lpsw6881	Prevented the possibility of sending a group membership request with empty list.
Version 1001	
None	

# 7.5 Protocol Changes

ID	Description
Version 1014	
lpsw7585	Default Response (msg type 0x8101) has been modified and now includes Short Address and Source Endpoint. Please see Serial Command Set.
lpsw8401	Added a command to check network details.
Version 1013	
Version 1012	
Version 1011	
Version 1010	
lpsw7503	Add Group (msg type 0x0060) has been modified and now includes Group Name, Group Name Length, and Group Name Maximum Length. Please see Serial Command Set.
Version 1009	
lpsw7785	Read Attribute, Write Attribute response and Report Attribute payload has been modified which includes two bytes of attribute size. Please see Serial Command Set.
lpsw7840	Add Scene command has been modified and now includes Scene Data Length and Scene Data. Please see Serial Command Set.
lpsw7856	Added an option to enable/disable the request for Default Responses.
lpsw7637	Added a command to set the poll control check-in response parameters.
Version 1008	
Version 1007	
Version 1006	
Version 1005	
Version 1004	
Version 1003	
Version 1002	
Version 1001	
None	

# **Appendix A: Serial Protocol**

## A.1. Physical Characteristics

The serial link between the ZGWUI (ZigBee Gateway User Interface) and wireless microcontroller runs at 1Mbaud when the JN516x is contained in a USB dongle. The link settings are 8 data bits with no parity. No flow control (hardware or software) is used.

## A.2. Message Characteristics

The protocol reserves byte values less than 0x10 for use as special characters (Start and End characters, for example). So to allow data which contains these reserved values to be sent, a procedure known as "byte stuffing" is used. This consists of identifying a byte to be sent that falls into the reserved character range, sending an Escape character (0x02) first, followed by the data byte XOR'd with 0x10.

For example, if a non-special character with the value of 0x05 is to be sent:

- Send the Escape byte (0x02)
- XOR the byte to be sent with 0x10 (0x05 xor 0x10 = 0x15)
- Send the modified byte

The messages consist of the following:

- Start character (special character)
- Message type (byte stuffed)
- Message length (byte stuffed)
- Checksum (byte stuffed)
- Message data (byte stuffed)
- End character (special character)

1	2	3	4	5	6	7	8			n+6	n+7	n+8
0x01			r	า								0x03
Start Msg Type		Ler	ngth	Chksum			Da	ata			Stop	

#### Figure 1: Layout of message before byte stuffing

#### A.2.1.Start Character

The Start character is a single-byte special character with the value 0x01 and is sent as the first byte of any message to allow the receiving end to synchronise. Since this is considered a special character, it will be sent without modification.

#### A.2.2.Message Type

The message type is a 16-bit value identifying the nature of the data contained in the message payload. Values implemented are defined in the message table.

### A.2.3.Message Length

The message length is a 16-bit value equal to the number of bytes in the payload section of the message, sent most significant byte first.

### A.2.4.Checksum

The checksum is an 8 bit value calculated by XORing the following (starting with a checksum of 0x00):

- Message type most-significant-byte
- Message type least-significant-byte
- Message length most-significant-byte
- Message length least-significant-byte
- Data bytes

The checksum is calculated before byte stuffing the message.

#### A.2.5.Message Data

The message data is a number of bytes equal to the value sent as the message length field. The number of bytes transmitted via the UART may be higher due to presence of escape bytes sent to identify values that fall in the reserved range. All multi-byte binary data is sent in network byte order (big-endian).

### A.2.6.End Character

The end character is a single byte special character with the value 0x03 and is sent as the last byte of any message to allow the receiving end to synchronise. Since this is considered a special character, it will be sent without modification.

#### A.2.7. Sequence

All commands generate a synchronous response code followed by any asynchronous responses as they become available. There is no sequence number associated with each command/response – the user must ensure that commands are issued sequentially.

Expected command response sequence:

Direction	Message
Host -> Node	Command e.g. Get Version
Node -> Host	Status e.g. OK or Error, Not implemented
Node -> Host	Optional data messages as requested by command, e.g. Version List

## A.3. Data Types

The following data types are used in messages between the host and slave devices. All message definitions use 32-bit integer types, unless otherwise specified.

Name	Туре
uint8_t	Unsigned 8 bit integer (one byte)
uint16_t	Unsigned 16 bit integer (two bytes)
uint32_t	Unsigned 32 bit integer (four bytes)
uint64_t	Unsigned 64 bit integer (eight bytes)
uint128_t	Unsigned 128 bit integer (sixteen bytes)
string	Buffer of characters (Variable Length, NULL Terminated)
data	Buffer of bytes (Variable length, calculated using message length)

### A.4.Response Codes

The node acknowledges each command with an "ACK" message. The message is defined in the message table.

# **Appendix B: Serial Command Set**

## **B.1. Common Commands**

In the following tables, the term Node refers to the Control Bridge

### **B.1.1. ZigBee Stack and Node Management Commands**

Message	Message	Message Format	Expected
Direction	Description	5	Response
Node->Host	Message Description Status Msg Type = 0x8000	<pre></pre>	All status messages will have a sequence number sent back. Default of 0 for messages which are not transmitted over the air.
		Packet Type: The value of the initiating command request.

	Msg Type = 0x00D0		
Host->Node	Touch link factory	No Payload	Status
	reset target		
	Msg Type= 0x00D2		
Node->Host	Touchlink Status	<status: uint8_t=""></status:>	
	Msg Type = 0x00D1	<joined address:="" node="" short="" uint16_t=""></joined>	
		Status	
		0 = Success	
		1 = Failure	

### **B.2.2. Identify Cluster Commands**

Message	Message	Message Format	Expected
Direction	Description		Response
Host->Node	Identify Trigger Effect Msg Type = 0x00E0	<address mode:="" uint8_t=""> <target address:="" short="" uint16_t=""> <source endpoint:="" uint8_t=""/> <destination endpoint:="" uint8_t=""> <effect id:="" uint8_t=""> <effect gradient:="" uint8_t=""></effect></effect></destination></target></address>	Status Data indication

# **B.2.3. On/Off Cluster Commands**

Message Direction	Message Description	Message Format	Expected Response
Host->Node	On / Off with Effects Msg Type = 0x0092	<address mode:="" uint8_t=""> <target address:="" short="" uint16_t=""> <source endpoint:="" uint8_t=""/> <destination endpoint:="" uint8_t=""> <effect id:="" uint8_t=""> <effect gradient:="" uint8_t=""></effect></effect></destination></target></address>	Status Data indication
Host->Node	On / Off Timed Msg Type = 0x0093	<pre><address mode:="" uint8_t=""> <target address:="" short="" uint16_t=""> <source endpoint:="" uint8_t=""/> <destination endpoint:="" uint8_t=""> <onoff: uint8_t=""> <on time:="" uint8_t=""> <on time:="" uint8_t=""> <on time:="" uint8_t=""></on></on></on></onoff:></destination></target></address></pre>	Status Data indication

## **B.2.4. Scenes Cluster Commands**

Message	Message	Message Format	Expected
Direction	Description		Response
Host->Node	Add Enhanced Scene	<address mode:="" uint8_t=""></address>	Status
	Msg Type = 0x00A7	<target address:="" short="" uint16_t=""></target>	Data indication
		<source endpoint:="" uint8_t=""/>	
		<destination endpoint:="" uint8_t=""></destination>	
		<group id:="" uint16_t=""></group>	
		<scene id:="" uint16_t=""></scene>	
		<transition time:="" uint8_t=""></transition>	
		<scene name:string=""></scene>	
		<length: uint8_t=""></length:>	
		<max length:="" uint8_t=""></max>	
		<data: data=""></data:>	
Host->Node	View Enhanced Host-	<address mode:="" uint8_t=""></address>	Status
	>Node Scene	<target address:="" short="" uint16_t=""></target>	Data indication
	Msg Type = 0x00A8	<source endpoint:="" uint8_t=""/>	
		<destination endpoint:="" uint8_t=""></destination>	
		<group id:="" uint16_t=""></group>	
		<scene id:="" uint16_t=""></scene>	
Host->Node	Copy Scene	<address mode:="" uint8_t=""></address>	Status
	Msg Type = 0x00A9	<target address:="" short="" uint16_t=""></target>	Data indication
		<source endpoint:="" uint8_t=""/>	
		<destination endpoint:="" uint8_t=""></destination>	
		<mode: uint8_t=""></mode:>	
		<from group="" id:="" uint16_t=""></from>	
		<from id:="" scene="" uint16_t=""></from>	
		<to group="" id:="" uint16_t=""></to>	
		<to id:="" scene="" uint16_t=""></to>	

# **B.2.5. Colour Cluster Commands**

Message	Message	Message Format	Expected
Direction	Description		Response
Host->Node	Enhanced Move to	<address mode:="" t="" uint8=""></address>	Status
	Hue	<target address:="" short="" t="" uint16=""></target>	Data indication
	Msg Type = 0x00BA	<source endpoint:="" uint8_t=""/>	
	5 71	<pre><destination endpoint:="" t="" uint8=""></destination></pre>	
		<pre></pre>	
		<enhanced hue:="" uint16_t=""></enhanced>	
		<transition time:="" uint16_t=""></transition>	
Host->Node	Enhanced Move Hue	<address mode:="" uint8_t=""></address>	Status
	Msg Type = 0x00BB	<target address:="" short="" uint16_t=""></target>	Data indication
		<source endpoint:="" uint8_t=""/>	
		<destination endpoint:="" uint8_t=""></destination>	
		<mode: uint8_t=""></mode:>	
		<rate: uint8_t=""></rate:>	
Host->Node	Enhanced Step Hue	<address mode:="" uint8_t=""></address>	Status
	Msg Type = 0x00BC	<target address:="" short="" uint16_t=""></target>	Data indication
		<source endpoint:="" uint8_t=""/>	
		<destination endpoint:="" uint8_t=""></destination>	
		<mode: uint8_t=""></mode:>	
		<step size:="" uint8_t=""></step>	
		<transition time:="" uint8_t=""></transition>	
Host->Node	Enhanced Move to	<address mode:="" uint8_t=""></address>	Status
	hue and saturation	<target address:="" short="" uint16_t=""></target>	Data indication
	Msg Type = 0x00BD	<source endpoint:="" uint8_t=""/>	
		<destination endpoint:="" uint8_t=""></destination>	
		<enhanced hue:="" uint32_t=""></enhanced>	
		<saturation: uint32_t=""></saturation:>	
		<transition time:="" uint8_t=""></transition>	
Host->Node	Colour Loop Set	<address mode:="" unt8_t=""></address>	Status
	Msg Type = 0x00BE	<target address:="" short="" uint16_t=""></target>	Data Indication

# **B.3. ZHA-specific Commands**

### **B.3.1. Door Lock Cluster Commands**

Message	Message	Message Format	Expected
Direction	Description		Response
Host->Node	Lock / Unlock Door Msg Type = 0x00F0	<address mode:="" uint8_t=""> <target address:="" short="" uint16_t=""> <source endpoint:="" uint8_t=""/> <destination endpoint:="" uint8_t=""> <lock uint8_t="" unlock:=""> 0 = Lock 1 = Unlock</lock></destination></target></address>	Status Data indication

# **B.3.2 IAS Cluster Commands**

Message	Message	Message Format	Expected
Direction	Description		Response
Host->Node	IAS Zone enroll response Msg Type = 0x0400	<address mode:="" uint8_t=""> <target address:="" short="" uint16_t=""> <source endpoint:="" uint8_t=""/> <destination endpoint:="" uint8_t=""> <enroll code:="" response="" uint8_t=""> <zone :="" id="" uint8_t=""></zone></enroll></destination></target></address>	Status
Node->Host	Zone status change notification Msg Type = 0x8401	<pre><sequence number:="" uint8_t=""> <endpoint :="" uint8_t=""> <cluster id:="" uint16_t=""> <src address="" mode:="" uint8_t=""> <src address="" address:="" based="" mode="" on="" or="" uint16_t="" uint64_t=""> <zone status:="" uint16_t=""> <extended status:="" uint8_t=""> <zone :="" id="" uint8_t=""> <delay: data="" each="" element="" uint16_t=""></delay:></zone></extended></zone></src></src></cluster></endpoint></sequence></pre>	

## **B.3.2 Poll Control Commands**

Message	Message	Message Format	Expected
Direction	Description		Response
Host->Node	Set Poll Control Check-in parameters Msg Type = 0x0A00	<enable bool_t="" fast="" polling:=""> <fast poll="" timeout:="" uint16_t=""></fast></enable>	Status

### **B.4. Exporting Persistent Data to Host**

The ZigBee Control Bridge node by default uses the internal EEPROM to hold persisted data. This is about 4Kbytes on a JN5168 device and can restrict network size. To overcome this it is possible to export the data persistence to the host device. This requires a binary with this feature turned "ON".

The host needs to provide message handshaking sequence to achieve this. How the host actually stores the persisted data is beyond the scope of the document.

Message	Message	Message Format	Expected
Direction	Description		Response
Node->Host	Host Persistent Data		Host persistent
	manager available	Node enquires about the availability of the Host	Data manager
	Request	PDM.	available
	Msg Type = 0x0300		response
Host->Node	Host persistent Data	The Host must send this as the first message to	·
	manager available	allow the Node to continue operation.	
	response		
	Msg Type = 0x8300		
Node->Host	Load Record Request	<record :="" id="" uint16_t=""></record>	Load Record
	Msg Type = 0x0201		response
Host->Node	Load Record	<status: uint8_t=""></status:>	Status
	response	<record id:="" uint16_t=""></record>	
	Msg Type = 0x8201	<total size:="" uint32_t=""></total>	
		<total blocks:="" number="" of="" uint32_t=""></total>	
		<current block:="" uint32_t=""></current>	
		<block size:="" uint32_t=""></block>	
		<data: each="" is="" item="" list="" uint8_t="" variable=""></data:>	
		status:	
		0- no record found	
		1- Record recovered	
Node->Host	Save Record request	<record id:="" uint16_t=""></record>	Save Record
	Msg Type = 0x0200	<total size:="" uint32_t=""></total>	response
		<total blocks:="" number="" of="" uint32_t=""></total>	
		<current block:="" uint32_t=""></current>	
		<block size:="" uint32_t=""></block>	
		<data: each="" is="" item="" list,="" uint8_t="" variable=""></data:>	
Host->Node	Save Record	<record id:="" uint16_t=""></record>	
	response	<total size:="" uint32_t=""></total>	
	Msg Type = 0x8200	<total blocks:="" number="" of="" uint32_t=""></total>	
		<current block:="" uint32_t=""></current>	
		<block size:="" uint32_t=""></block>	
Node->Host	Delete all records		
	Msg Type = 0x0202		

## **B.5. Extended Utilities**

The ZigBee Control Bridge also has some extra commands that are sent or received which provide extra debug or features.

Message Direction	Message Description	Message Format	Expected Response
Host->Node	Raw APS Data Request Msg Type = 0x0530	<address mode:="" uint8_t=""> <target address:="" short="" uint16_t=""> <source endpoint:="" uint8_t=""/> <destination endpoint:="" uint8_t=""> <profile id:="" uint16_t=""> <cluster id:="" uint16_t=""> <security mode:="" uint8_t=""> <radius: uint8_t=""> <data length:="" uint8_t=""> <data: auint8_t=""></data:></data></radius:></security></cluster></profile></destination></target></address>	Status
Node->Host	Router Discovery Confirm Msg Type = 0x8701	<status: uint8_t=""> <nwk status:="" uint8_t=""></nwk></status:>	
Node->Host	APS Data Confirm Fail Msg Type = 0x8702	<status: uint8_t=""> <src endpoint:="" uint8_t=""> <dst endpoint:="" uint8_t=""> <dst address="" mode:="" uint8_t=""> <destination address:="" uint64_t=""> <seq number:="" uint8_t=""></seq></destination></dst></dst></src></status:>	

# **Appendix C: Use Case Sequences**

### C.1. Gateway Start-up

The following sequence of messages is exchanged at startup. In the tables below, the Node refers to the Control Bridge

Direction	Message
Host->Node	Erase Persistent Data (Optional)
Node->Host	Status (If Erase command issued)
Host->Node	Reset
Node->Host	Status
Node->Host	Node Cluster List (multiple)
Node->Host	Node Attribute List (multiple)
Node->Host	Node Command ID List (multiple)
Host->Node	Get Version
Node->Host	Status
Node->Host	Version List
Host->Node	Set Extended PANID
Node->Host	Status
Host->Node	Set Channel Mask
Node->Host	Status
Host->Node	Set Security State & Key
Node->Host	Status
Host->Node	Set Device Type
Node->Host	Status
Host->Node	Start Network
Node->Host	Status
Node->Host	Network Formed / Joined

### **C.2. Touchlink Initiated by Another Control Node**

Direction	Message
Host->Node	Erase Persistent Data (Optional)
Node->Host	Status (If Erase command issued)
Host->Node	Reset
Node->Host	Status
Node->Host	Node Cluster List (multiple)
Node->Host	Node Attribute List (multiple)
Node->Host	Node Command ID List (multiple)
Host->Node	Get Version
Node->Host	Status
Node->Host	Version List
Host->Node	Set Extended PANID
Node->Host	Status
Host->Node	Set Channel Mask
Node->Host	Status
Host->Node	Set Security State & Key
Node->Host	Status
Host->Node	Set Device Type
Node->Host	Status
Host->Node	Start scan
Node->Host	Status
Node->Host	Network Joined/Failed
Node->Host	Touchlink status
Node->Host	Network formed

<b>C.</b> 3	<b>B. Network</b>	Formation	and Jo	oin Under	Control	of Host
-------------	-------------------	-----------	--------	-----------	---------	---------

Direction	Message
Host->Node	Erase Persistent Data (Optional)
Node->Host	Status (If Erase command issued)
Host->Node	Reset
Node->Host	Status
Node->Host	Node Cluster List (multiple)
Node->Host	Node Attribute List (multiple)
Node->Host	Node Command ID List (multiple)
Host->Node	Get Version
Node->Host	Status
Node->Host	Version List
Host->Node	Set Extended PANID
Node->Host	Status
Host->Node	Set Channel Mask
Node->Host	Status
Host->Node	Set Security State & Key
Node->Host	Status
Host->Node	Set Device Type
Node->Host	Status
Host->Node	Start scan
Node->Host	Status
Node->Host	Network Joined/Failed
Host->Node	Start form
Node->Host	Network formed

# C.4. Touchlink Initiated by Host

Direction	Message
Host->Node	Erase Persistent Data (Optional)
Node->Host	Status (If Erase command issued)
Host->Node	Reset
Node->Host	Status
Node->Host	Node Cluster List (multiple)
Node->Host	Node Attribute List (multiple)
Node->Host	Node Command ID List (multiple)
Host->Node	Get Version
Node->Host	Status
Node->Host	Version List
Host->Node	Set Extended PANID
Node->Host	Status
Host->Node	Set Channel Mask
Node->Host	Status
Host->Node	Set Security State & Key
Node->Host	Status
Host->Node	Set Device Type
Node->Host	Status
Host->Node	Start scan
Node->Host	Status
Node->Host	Network Joined/Failed
Host->Node	Initiate Touchlink
Node->Host	Touchlink status
Node->Host	Network formed

### C.5. Warm Restart

Direction	Message
Node->Host	Warm restart status

### C.6. Join Notification - Device Joining Network Formed by Gateway

Direction	Message
Node->Host	New device joined indication
Host->Node	Match descriptor request
Node->Host	Status
Node->Host	Match descriptor response
Host->Node	Add Group
Node->Host	Status
Host->Node	Identify
Node->Host	Status
Node->Host	Identify response

## C.7. Gateway Joins Existing Network

Direction	Message
Host->Node	Match descriptor request (Broadcast)
Node->Host	Status
Node->Host	Match descriptor response
Host->Node	Add Group
Node->Host	Status
Host->Node	Identify
Node->Host	Status
Node->Host	Identify response

### **C.8. Binding Control**

No sequence required – issue Bind and Unbind commands and get status back

### **C.9. Identification**

No sequence required – commands and get status back.

For HA and ZLL:

- Identify Send (0x0070)
- Identify Query (0x0071)

For ZLL bulbs:

• Identify Trigger Effect (0x00E0)

### C.10. Scene Management

No sequence required – issue commands and get status back. For HA devices:

- View Scene (0x00A0)
- Add Scene (0x00A1)
- Remove Scene (0x00A2)
- Remove all scenes (0x00A3)
- Store Scene (0x00A4)
- Recall Scene (0x00A5)
- Scene membership request (0x00A6)

For ZLL devices:

- Add Enhanced Scene (0x00A7),
- View Enhanced Scene (0x00A8)
- Copy Scene (0x00A9)

### C.11. Group Management

No sequence required - issue commands and get status back.

- Add Group (0x0060)
- View Group (0x0061)
- Get Group Membership (0x0062)
- Remove Group (0x0063)
- Remove All Groups (0x0064)
- Add Group if identify (0x0065)

## C.12. On/Off Control

Direction	Message
Host->Node	On / Off Send (0x0090)
Node->Host	Status
Node->Host	On/Off Indication

Or

Direction	Message
Host->Node	On / Off Timed Send (0x0091)
Node->Host	Status
Node->Host	On/Off Indication

## C.13. Level Control

No sequence required – issue commands and get status back.

- Move to Level (0x0080)
- Move to level with/without On/Off (0x0081)
- Move Step (0x0082)
- Move Stop Move (0x0083)
- Move Stop with On/Off (0x0084)

## C.14. Colour Control

For HA bulbs:

- Move to Hue (0x00B0)
- Move Hue (0x00B1)
- Step Hue (0x00B2)
- Move to saturation (0x00B3)
- Move saturation (0x00B4)
- Step saturation (0x00B5)
- Move to hue and saturation (0x00B6)
- Move to colour(0x00B7)
- Move Colour (0x00B8)
- Step Colour (0x00B9)

#### For ZLL colour bulbs:

- Enhanced Move to Hue (0x00BA)
- Enhanced Move Hue (0x00BB)
- Enhanced Step Hue (0x00BC)
- Enhanced Move to hue and saturation (0x00BD)
- Colour Loop Set (0x00BE)
- Stop Move Step (0x00BF)
- Move to colour temperature (0x00C0)
- Move colour temperature (0x00C1)
- Step colour temperature (0x00C2)

# **Revision History**

Version	Notes
1000	First internal release
1001	Released on the JN-SW-4168 SDK v1364
1002	Added group membership and Raw Data send feature
1003	Bugs fixed in software, as described in Section 7.4
1004	Compilation issue fixed, as described in Section 7.4
1005	Features added in software and bugs fixed, as described in Section 7.2 and Section 7.4
1006	Rebuilt for JN-SW-4168 SDK v1455.
	New software features added and bugs fixed, as described in Section 7.2 and Section 7.4
1007	Rebuilt for JN-SW-4168 SDK v1461.
1008	Rebuilt for JN-SW-4168 SDK v1470.
1009	New software features added and bugs fixed, as described in Section 7.2 and Section 7.4
1010	New software features added and bugs fixed, as described in Section 7.2 and Section 7.4
1011	Rebuilt for JN-SW-4168 SDK v1595.
1012	Rebuilt for JN-SW-4168 SDK v1620.
	New software features added and bugs fixed, as described in Section 7.2 and Section 7.4
1013	Fixed an issue that prevented ZigBeeNodeControlBridge.zpscfg from being edited outside of a text editor.
1014	New software features added and bugs fixed, as described in Section 7.2 and Section 7.4

# **Important Notice**

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.
